

Example readings from measuring CO<sub>2</sub>, Temperature, and Lighting Levels, and their associated findings. Each of these readings were part of a larger report that allowed the building owners/managers to identify opportunities to decrease energy use and costs that were relatively easy to implement.

## Carbon Dioxide

## Temperature

When the majority of the building zones are at relatively constant temperatures (even during unoccupied periods), and/or set at colder temperatures than required during the summer, there are likely good opportunities to alter your thermostat schedules and save energy!

## Lighting Control (on/off)
